

**Enriched API  
service for  
e-Invoicing.**  
**The easier way  
to handle your  
tax compliance.**

Our enriched API service is the preferred e-invoicing service for its ease of use and convenience. With enriched API, all you have to do is enter the details of your invoices into your existing accounting system and then pass it on to us. We then validate, encrypt, and transmit this data to the IRP system. The IRP system generates digitally signed e-invoice and a QR code and transmits this back to us, and we in turn send this to your system to prepare the invoice for printing. This means the printed invoice already contains the IRN and embedded QR code. With secure, real-time transmission, you have a hassle-free, delay-free process for e-invoicing compliance.

# The advantages of using our enriched API services

Data encryption and decryption are handled by us

Capability to process high volumes through data partitioning and merging features - there is no data limit per API

We carry out comprehensive tax validations before transmitting data to IRP

Custom data format with the option to merge data with multi-input; the file formats can include XML, JSON and others. The received data format can be customised as well

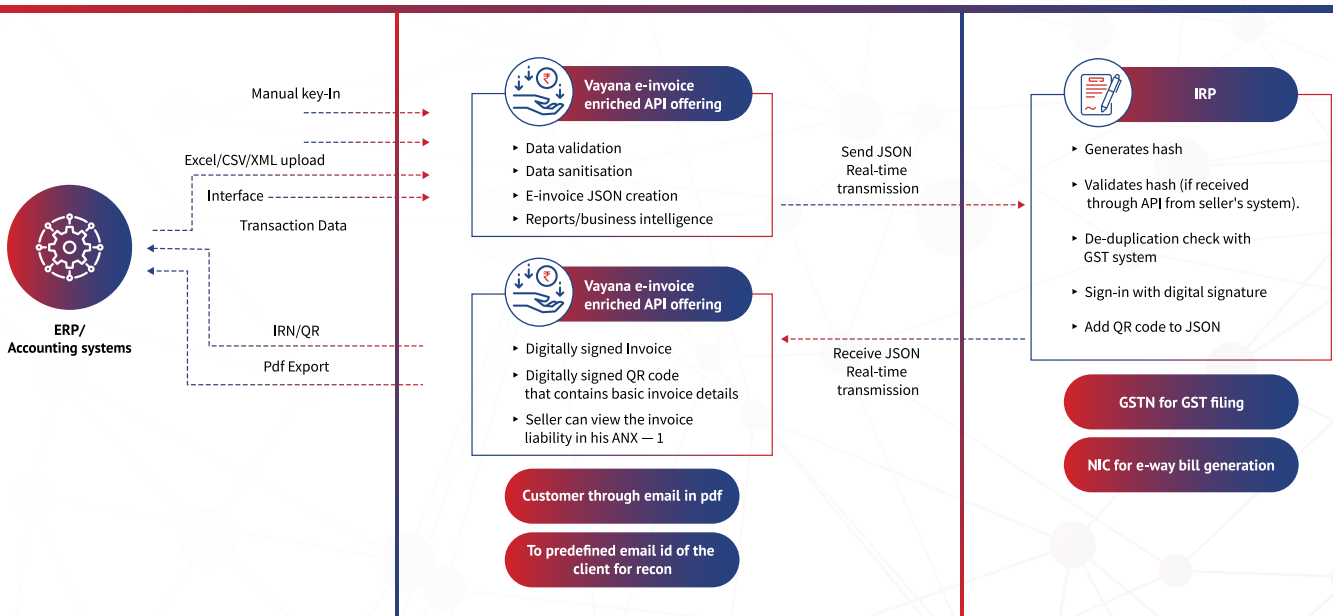

Change management through enriched API service; as part of our enriched API services, we insulate you from change management efforts to keep up with changing API formats and on an implied basis, changes to passthrough APIs. The passthrough APIs entail significant development effort given the complexity of the data security protocols that must be adhered to, the wide number of APIs that must be integrated, and the continuous resource commitment to conform to evolving APIs from GSTN. Integrating with our enriched API eliminates these investments of time and effort

## Client Environment

## Vayana Environment

## E-Invoice Registration Portal (IRP)

# Why choose our enriched API?

## Savings in time and effort

Small companies find it cumbersome to maintain source documents of their suppliers and customers. Businesses operating on modest numbers are also more vulnerable to delays if they are not conforming to a real-time invoice referencing system that can generate the IRNs (Invoice Reference Numbers) in sync with the process. Our enriched API stack solves these problems by allowing easy, quick and real time generation of e-invoices.

## Reliability and performance

Our platform offers total dependability thanks to redundancies at all levels of our architecture – zero downtime over the last five years, with over 4 billion APIs processed.

## Scalability and agility

Platform is auto scalable and concurrent to any change/s introduced, with no translation delay.

## Total support

We provide 360-degree support. One-click communication, hassle-free integration, and 100% uptime for all our partner ASPs/ERPs/fintechs.

## Experience and leadership

We are market leaders in India for API services for GST, e-way bill and e-invoicing to multiple ASPs (Application Service Providers like SAP, Oracle, Intuit, etc.).

## 1 out of every 5 e-invoices in India are generated by Vayana

We are India's largest supply chain finance network, and we run many business-enabling initiatives such as 'Good Business Score' in conjunction with CRIF (one of the world's largest Credit Bureaus). This enables deep understanding of invoicing (and e-invoicing) functions of businesses.
